## **Adverse Drug Reaction Reporting**

From version 7.1 mSupply mobile includes the ability to report on Adverse Drug Reactions It is able to be used with AEFI (Adverse Events From Immunisation) reporting.

## Set up

## **Entering an adverse reaction report**

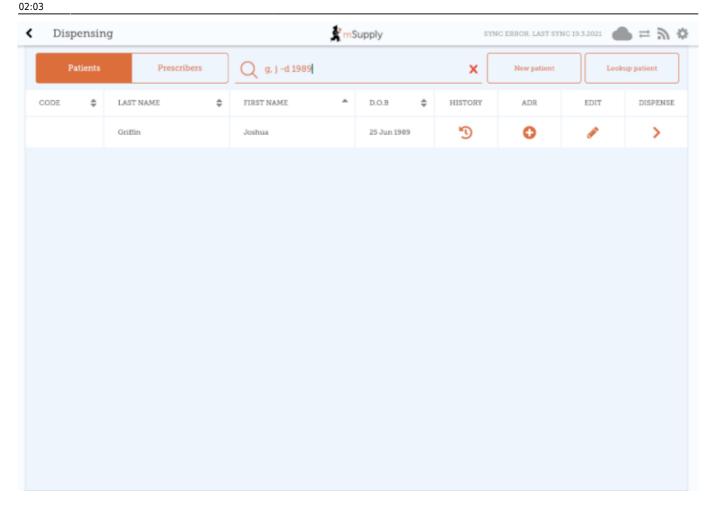

To report, a patient must be entered. If you are at the facility where the drug was administered, the patient should already be in the system.

If the patient isn't in the list:

- 1. Tap the **Lookup Patient** button to query the central server to retrieve their name.
- 2. If you still can't find them (which should be rare), then you can tap **New Patient** to enter their details.

Once the patient is found, tap the **plus** icon in the ADR column to add an adverse event report for that patient.

 $\label{lem:update:upd$ 

What is shown on the form is configurable on the server. If more than 1 adverse reaction form has been defined, you will be shown a list of forms, and you need to choose the appropriate one before proceeding. If only 1 form has been configured, you will be taken directly to the form to enter the adverse event details.
